

4.08.02

RELEASE NOTES

(v4.08.02 – February 23, 2024)

This latest version corrects a few bugs that were identified after the StormWise v4.08.01 release in January 2024. These notes describe the bugs that are fixed with this StormWise v4.08.02 release.

Bug Fixes

Creating a Polyline Using Offset Command

Occasionally, when using the “Q” command to make an offset copy of a selected polyline, the program created the new polyline with the offset only applied partially. This occurred when the angle between line segments was close to 180 degrees. This has been corrected and the new polyline is offset along the entire length of the line.

Applying Graphic View Port

When a saved view port is applied, the graphic view updates only the displayed location, zoom level, and the saved item selections (i.e., graphic element selections on the data tree, selected rasters, selected map layers). Settings related to the data tree appearance and section dividers do not revert to the saved settings in this latest version. This change was made in order to maintain workflow.

Edit Polyline Selection

The graphic view “Edit Polyline” tool would not allow users to right click to cycle through nearby selectable items. This has been corrected.

Simple Basin Error

This release corrects a false error that was previously issued for Simple Basins when the “Basin Specification” rainfall option was selected.
